

Techno-Feeder Dry Feeding Wall

Techno-Feeder is a restrictive dry feeding wall, providing an optimal control of daily gain and lean meat percentage. The system itself is a wall, which at the same time serves the purpose of a divider between 2 pens. This gives the option to restrictively distribute the feed to the 2 pens, as well as to spread the feed evenly in the long trough. The wall is developed with inside down pipes – numbers of down pipes depends on the length of the trough, in order to guarantee space for each animal and allow them to eat side-by-side. From the computer or a pda, it is possible to regulate the amount of dry feed, as well as regulate the number of feedings during the day. It is possible to distribute water in the trough, before dropping the feed. System can use both pellets and meal.

TECHNO-FEEDER

Pre watering

Schematic diagram

Feeding

Feeding over the complete trough

Facts

- Restrictive feeding dry feed
- Feeding along the complete trough
- Excellent feed hygiene
- Up to 10 feeding periods per day
- Pre watering according to amount of feed
- Ideal for raising gilts
- Control of the feed intake and a high lean meat percentage for finisher
- Standard feed curves
- Feed curves after own selection
- Curve for sick pigs
- Control feeding guarantees simple adjustment
- Uniform performance of the pigs
- High lean meat percentage
- All over better result
